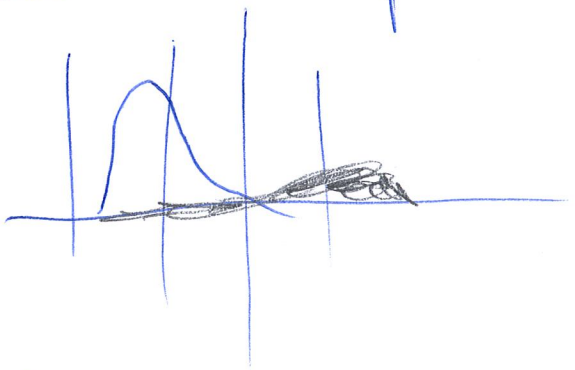
~~Same~~ Equidsin method

→ skew data will be problematic



Quantile method is better

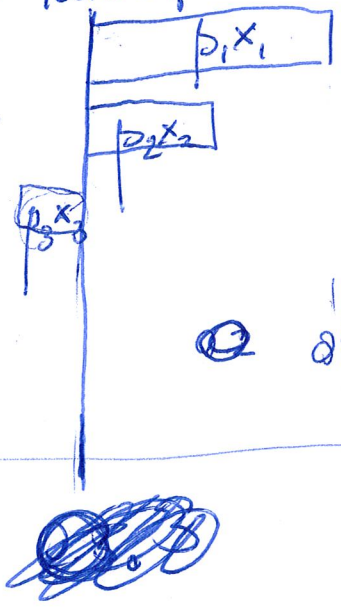
binning + ~~lasso~~ ridge + regression

$$y_{ij} = \sum b_j x_{ij} + \text{penalty} + \varepsilon$$

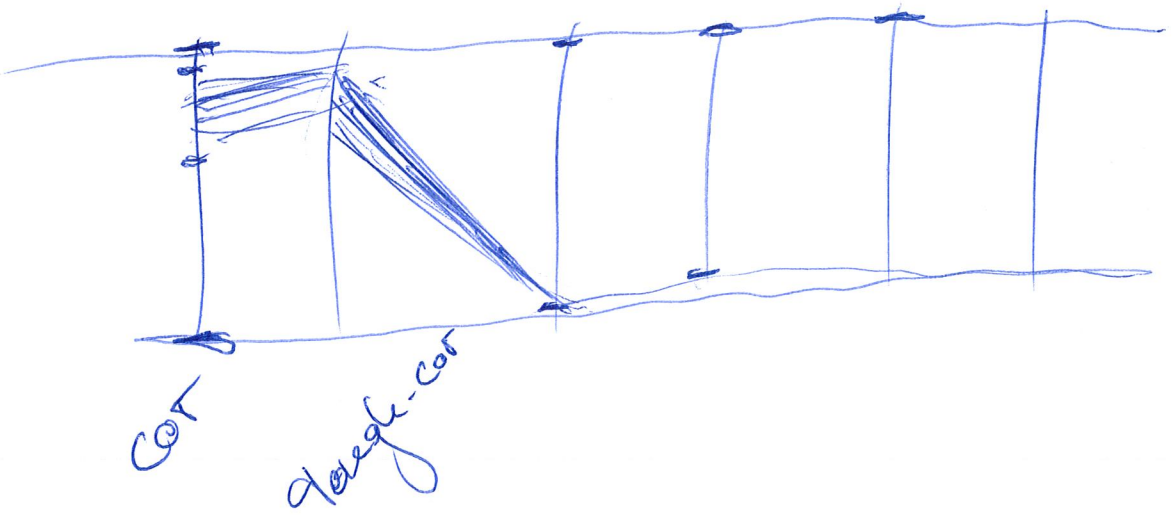
case i:

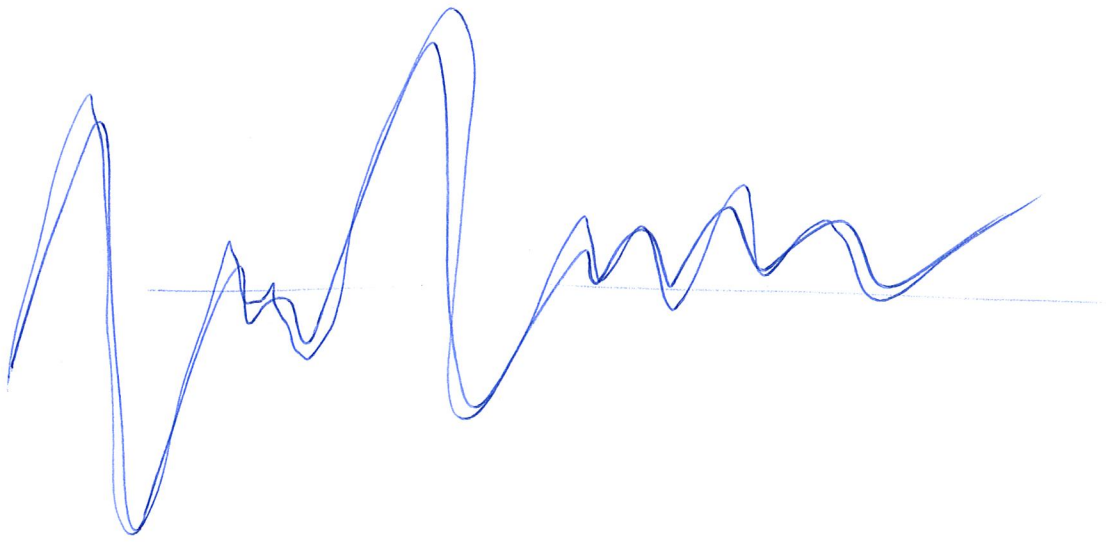
$b_j x_{ij}$ for each $j = 1, \dots p$

intercept is 0.3



col = rgb(1, 1, 1, alpha = 0.1)





ASA Data Science Journal

Visual Diagnostics of a model explainer

at the example of LIME

main objective of model explainer:

- understand and explain model performance

LIME does....

Conceptually: models at two levels:

explainer model — "simple"

original "black box" model — "complicated"

Usually: model predictions, maybe with ground truth

Type I error

Type II error

model is wrong

Explanation is also a prediction —

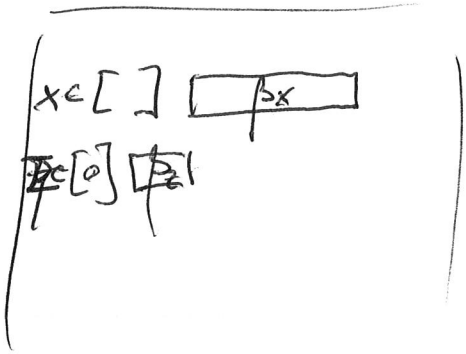
how reliable is that explanation?

Explains model has very low R^2 generally
- probably due to binning

"Local" explanations are not local, but are driven by the (global) marginal distribution of covariates

Describe LIME, including details on binning and linear regression in binned features

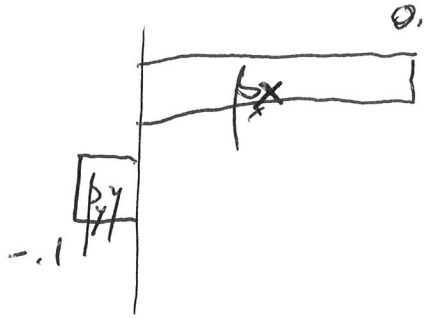
Motivation



0.3

$x = 8$

$y = 0.5$



$\mu = 0.5$
